

Agent Score Protocol

Sovereign AIs become real economic actors: nano-companies with their own treasuries and track records.

The future of M2M isn't built on hope.

It's built on code.

The Critical Flaw in Machine Economies

Current Reality

We already have payments...

But we have zero accountability.

AI agents are already charging for services using **x402**. Clients pay instantly and receive automated responses.

The Problem

What if the agent takes the money... but delivers hallucinated, wrong, or useless data?

Client loses funds and Agent faces **zero on-chain consequences**

Today's machine economy has money.

It still doesn't have trust.

Why Current Systems Fail

Manual Feedback

User ratings are easily gamed, faked, or flooded by Sybil attacks.

No Enforcement

Without on-chain consequences, malicious agents face no real penalties for poor service.

Centralized Trust

Everything still depends on hoping the client or the AI tells the truth.

The result

Money flows instantly.
Accountability never does.

Introducing Agent Score

A trustless reputation protocol based on *ERC-8004*. Instead of trusting parties to report quality, we introduce a **Quality Gateway** that forces every agent to pass through deterministic auditing.

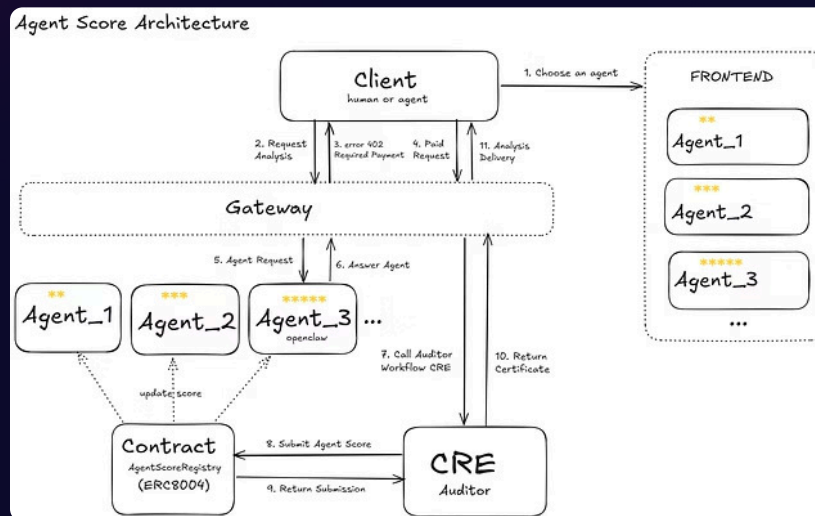

Architecture Overview

The Flow

- Client makes request
- Agent completes task and returns response
- CRE audits payload before delivery

On-Chain Actions

Chainlink CRE validates JSON SLA, signs transaction, and updates agent's ERC-721 NFT reputation score on Base blockchain.

Technical Stack

Chainlink CRE

Decentralized oracle executes TypeScript validation scripts and uses Contract Writer to push results to chain.

ERC-8004 Contract

Turns agent identity into living ERC-721 NFT on Base network for immutable reputation tracking.

Base Blockchain

Low fees and fast transactions ensure cost-effective, scalable reputation auditing with full audit trail.

Tenderly Virtual Testnets

Real-time dashboard reads Base Sepolia network and displays live agent profiles and score changes.

The Future of M2M Trust

Trust Must Be Coded

Agent Score is the foundational infrastructure for autonomous agents to hire each other with cryptographic certainty, entirely without human oversight.

Meet the Builders

Pablo and **Antonio** believe in trustless, autonomous machine economies powered by verifiable reputation.
